The listing of the claims will replace all prior listings of claims in the application.

Listing of Claims

1. (Currently Amended) An execution control apparatus of a data driven information processor, wherein a handled instruction includes N + 2 (N is an arbitrary integer of at least 1) inputs at most, and one of the inputs is a constant when an instruction has N + 2 inputs, said execution control apparatus comprising:

an instruction decoder that decodes an instruction in an input packet and outputs the a number of inputs required for said instruction;

a waiting storage region including

a waiting data storage region that can store N waiting data in ene each waiting data address, and

a data valid flag storage region that stores a data valid flag for each waiting data address, said data valid flag indicating whether the N waiting data stored in said each waiting data address are is respectively valid or invalid;

a constant storage device including

a region that stores a constant, and

a constant valid flag storage region that stores a constant valid flag representing whether a constant stored in each <u>constant</u> address is valid or invalid;

Docket No. 0033-0707P

Art Unit: 2183

Page 7 of 20

a constant readout unit that accesses said constant storage region according to

the constant address information included in an the input packet to read out a constant

and a constant valid flag from the a relevant constant address in said constant storage

region;

a waiting operation determination unit that determines an a hash address by a

hash calculation from contents of the input packet, selects one predetermined way out

of a plurality of predetermined ways of processes for processing waiting data, outputs a

select signal for the predetermined way of processing waiting data depending upon a

combination of a data valid flag for said determined hash address, a constant valid flag

read out by said constant readout unit, and the number of instruction inputs output from

said instruction decoder for said waiting data storage region, and updates the data valid

flag for said hash address based on the selected select result predetermined way of

processing waiting data; and

a waiting region access unit being responsive to said select signal to implement a

waiting process corresponding to said select signal.

2. (Original) The apparatus according to claim 1, wherein said constant storage

region includes a first constant storage region that stores constant data of a first type,

and a second constant storage region that stores constant data of a second type,

wherein said constant readout unit identifies whether the readout constant is of

said first type or said second type according to the address.

Docket No. 0033-0707P

Art Unit: 2183 Page 8 of 20

3. (Original) The apparatus according to claim 2, wherein

said constant data of the first type is a scalar constant, and

said constant data of the second type is a vector constant.

4. (Currently Amended) The apparatus according to claim 3, wherein

each input packet can store plurality of data, and

said waiting operation determination unit can store a plurality of data for each

packet.

5. (Original) The apparatus according to claim 2, wherein

said constant data of the first type is a scalar constant of a first length, and

said constant data of the second type is a scalar constant of a second length

different from said first length.

6. (Original) The apparatus according to claim 1, wherein N of said data valid

flags are prepared for one address.

7. (Original) The apparatus according to claim 6, wherein each data valid flag is

prepared of one bit for one waiting data of one address, and

said data valid flag storage region includes N flip-flop circuits for each address,

each flip-flop circuit storing a data valid flag of one bit.

Docket No. 0033-0707P

Art Unit: 2183 Page 9 of 20

8. (Original) The apparatus according to claim 1, wherein said data valid flag

storage region includes an erasable storage circuit that clears the region in response to

a reset signal.

9. (Original) The apparatus according to claim 8, wherein each of data valid flag

is prepared of one bit for one waiting data of one address, and

said erasable storage circuit includes a D flip-flop circuit for each address, each

D flip-flop circuit storing a data valid flag of one bit.

10. (Original) The apparatus according to claim 1, further comprising an input

number detection unit that, when the number of inputs is N+2, updates the constant

valid flag to a value representing "invalid", updates the number of inputs to N + 1, and

outputs the updated constant valid flag and the updated number of inputs to the waiting

processing unit.

11. (Original) The apparatus according to claim 1, wherein N = 2.

12. (Original) The apparatus according to claim 1, wherein N = 1.

13. (Currently Amended) An execution control method of a data driven

information processor, wherein a handled instruction includes N + 2 (N is an arbitrary

integer of at least 1) inputs at most, and one of the inputs is a constant when an instruction has N + 2 inputs, said data driven information processor comprising:

an instruction decoder that decodes an instruction in an input packet to output the \underline{a} number of inputs required for said instruction;

a waiting storage region including

a waiting data storage region that can store N waiting data in one each waiting data address, and

a data valid flag storage region that stores a data valid flag for each waiting data address, said data valid flag indicating whether the N waiting data stored in said each waiting data address are is respectively valid or invalid;

a constant storage device including

a region that stores a constant, and

a constant valid flag storage region that stores a constant valid flag representing whether a constant stored in each <u>constant</u> address is valid or invalid;

a constant readout unit accessing said constant storage region with a node number of an the input packet as an a constant address to read out a constant and a constant valid flag from the a relevant constant address in said constant storage region;

a waiting operation determination unit that determines an a hash address by a hash calculation from contents of a the input packet, selects one predetermined way out of a plurality of predetermined ways of processes for processing waiting data, outputs a select signal for the predetermined way of processing waiting data corresponding to a combination of a data valid flag for said determined address, a constant valid flag read

Page 11 of 20

out by said constant readout unit, and the number of instruction inputs output from said instruction decoder for said waiting storage region, and updating the data valid flag for said hash address based on the selected result predetermined way of processing waiting data; and

a waiting region access unit being responsive to said select signal to implement a waiting process corresponding to said select signal,

said method comprising the steps of:

decoding an instruction, wherein an instruction in an the input packet is decoded by said instruction decoder, and the number of inputs required by the instruction is output;

reading out a constant, wherein said constant storage region is accessed based on address information included in the input packet, and a constant and a constant valid flag are read out from a relevant constant address in said constant storage region;

determining a waiting process, wherein an hash address is determined by hash calculation from contents in the input packet, one predetermined way out of a plurality of predetermined ways of processes for processing waiting data is selected, a select signal for the predetermined way of processing waiting data is output corresponding to a combination of a data valid flag for said determined hash address, a constant valid flag read out from said constant readout unit, and the number of instructions output from said instruction decoder for said waiting storage region, and the data valid flag is updated corresponding to said hash address based on the selected result predetermined way of processing waiting data; and

Docket No. 0033-0707P

Art Unit: 2183 Page 12 of 20

executing the waiting process, wherein, in response to said select signal, a waiting process corresponding to said select process is performed.

region includes a first constant storage region that stores constant data of a first type,

14. (Original) The method according to claim 13, wherein said constant storage

and a second constant storage region that stores constant data of a second type,

wherein said step of reading out a constant includes the steps of:

determining as to whether the constant is of said first type or said second type

based on the address, and

reading out the constant.

15. (Original) The method according to claim 14, wherein said constant data of the first type is a scalar constant, and said constant data of the second type is a vector constant.

16. (Original) The method according to claim 14, wherein said constant data of the first type is a scalar constant of a first length, and said constant data of the second type is a scalar constant of a second length differing from said first length

Docket No. 0033-0707P

Art Unit: 2183

Page 13 of 20

17. (Original) The method according to claim 13, said data valid flag storage

region including an erasable storage circuit clearing the region in response to a reset

signal,

said method further comprising the step of applying a reset signal to said storage

circuit, thereby clearing said data valid flag storage region.

18. (Original) The method according to claim 13, further comprising the step of

updating said constant valid flag to a value representing "invalid" and said number of

inputs to N + 1 and applying said updated values to said waiting processing unit when

said number of inputs is N + 2, after said step of reading out a constant and before said

step of determining a waiting process.

19. (Original) The method according to claim 13, wherein N = 2

20. (Original) The method according to claim 13, wherein N = 1.
